Headline	Syarikat Takaful Malaysia Berhad (6139.KL) Shares Higher 18.03% over The Past Month				

After a recent market scan, we can see that Penguin International Limited (BTM.SI) shares have moved 18.03% higher over the past month. Tracking performance over the last 5 sessions, shares have moved 1.41%. Over the last half-year, shares have changed 12.50%. Over the last full year, shares have moved 4.35%.

Investors are often faced with difficult decisions when trading the equity market. Sometimes, the decision to sell a certain stock may be just as important as the decision to buy the stock in the first place. Individual investors may have done the research, had some good fortune, and are now dealing with a big winner in the portfolio. Even though a stock has had a big run, it may be time to unload and take some profits. Holding on to a winner too long can eat into profits that may have been better spent getting into another promising name. On the flip side, investors may have trouble letting go of an underperforming portfolio loser. The emotional attachment to a stock can cause the investor to hold onto a stock for way too long. Maybe the stock was thoroughly researched, but it just keeps going lower. Being able to cut the ties instead of waiting for a bounce back may be beneficial for portfolio health in the long run.

After conducting extensive research and thoroughly combing through fundamentals and technical, it may be time for the investor to make some tough buy or sell decisions. Investors may be keen to the notion that the frequency of being right in making decisions may not be as important as the magnitude of the correctness.

Technical traders may be looking at recent indicator levels on shares of SYARIKAT TAKAFUL MALAYSIA BERHAD (6139.KL). After a recent check, the 50-day Moving Average is 4.14, the 200-day Moving Average is 3.91, and the 7-day is noted at 4.44. Moving averages have the ability to be used as a powerful indicator for technical stock analysis. Following multiple time frames using moving averages can help investors figure out where the stock has been and help determine where it may be possibly going. The simple moving average is a mathematical calculation that takes the average price (mean) for a given amount of time.

SYARIKAT TAKAFUL MALAYSIA BERHAD (6139.KL)'s Williams Percent Range or 14 day Williams %R is sitting at -50.00. Typically, if the value heads above -20, the stock may be considered to be overbought. On the flip side, if the indicator goes under -80, this may signal that the stock is oversold.

Traders may be leaning on technical stock analysis to help with investing decisions. SYARIKAT TAKAFUL MALAYSIA BERHAD (6139.KL) currently has a 14-day Commodity Channel Index (CCI) of 172.16. Despite the name, CCI can be used on other investment tools such as stocks. The CCI was designed to typically stay within the reading of -100 to +100. Traders may use the indicator to determine stock trends or to identify overbought/oversold conditions. A CCI reading above +100 would imply that the stock is overbought and possibly ready for a correction. On the other hand, a reading of -100 would imply that the stock is oversold and possibly set for a rally.

Technical traders often make a point of keeping an eye on the ATR or Average True Range of a particular equity. Currently, SYARIKAT TAKAFUL MALAYSIA BERHAD (6139.KL) has a 14-day ATR of 0.14. The Average True Range is an investor tool used to measure stock volatility. The ATR is not used to figure out price direction, just to measure volatility. The ATR is an indicator developed by J. Welles Wilder. Wilder has developed multiple indicators that are still quite popular in today's investing landscape. The general interpretation of the ATR is the higher the ATR value, the higher the volatility.

Currently, the 14-day ADX for SYARIKAT TAKAFUL MALAYSIA BERHAD (6139.KL) is sitting at 43.39. Generally speaking, an ADX value from 0-25 would indicate an absent or weak trend. A value of 25-50 would support a strong trend. A value of 50-75 would identify a very strong trend, and a value of 75-100 would lead to an extremely strong trend. ADX is used to gauge trend strength but not trend direction. Traders often add the Plus Directional Indicator (+DI) and Minus Directional Indicator (-DI) to identify the direction of a trend.

Investors might be looking at various types of stocks that can be added to the portfolio. Selecting a wider range of equities may help the portfolio withstand prolonged market turmoil. Growth stocks typically have the potential to produce profit growth and above average revenues. Growth companies may reinvest a large amount of earnings back into the business. Fast growing companies can be attractive, but it may be important to verify whether or not shares are valued properly before buying in. Some investors may choose to select cyclical stocks. Cyclical include companies that are very sensitive to the overall swings of the economy. Investors might also turn to adding foreign stocks to the portfolio. Keeping the portfolio diversified may end up being an important factor for longer-term investing success.
